## YOUR NURSE CALL EXPERT

### Vision Link can send emergency alarm messages to nursing staff wearing our Micro16® Radio.

The Systems Technologies RadioBridge connects the Vision Link Wireless Nurse Call System with two way radios using a combination of software and a base station. Vision Link announces alarms through the MICRO16® radios and escalates the message until canceled at the originating station or pendant. Staff can use the radios to communicate or ask for assistance. This eliminates the need for overhead paging and creates a more residential atmosphere. It also speeds up staff response times and increases resident satisfaction while providing two way communication on a device not much larger than a pager.

Vision Link reports are a powerful management tool. When combined with two way radio alarm notification to your staff to reduce response times, you can provide the highest level of care for your residents while ensuring the safety of your staff.
